Every story world breaks.

One Piece, chapter 1[1]

A bandit knocks the bar door off its hinges. Later in the scene the door is back. Oda's answer to a reader: a carpenter fixed it.

Harry Potter and the Goblet of Fire[2]

Voldemort killed James, then Lily, yet James stepped out of the wand first. Bloomsbury corrected later editions: Lily first, then James.

Dr Watson's wound

"struck on the shoulder by a Jezail bullet"[3]

"I had a Jezail bullet through it" (his leg)[4]

> **Story Bible found Watson's wound on its own.** It read 31 Sherlock Holmes documents, a person accepted the facts, and a deterministic rule paired "shoulder" with "leg", quoting both books.

Sources: 1 One Piece ch. 1 · 2 Salon 2001 · 3 A Study in Scarlet · 4 The Sign of the Four

Problem

Canon lives in people's heads, and people move on.

Who it hurts

- **Narrative leads at game studios:** lore, quests and barks across many documents and many hands.
- **Writers' rooms:** a US TV room starts at 3 writers or more under the 2023 WGA contract.[7]
- **Series novelists:** 75% of indie book sales are books in a series.[8]
- **Worldbuilders:** magic rules, travel times and histories that start long before page one.

How canon is kept today

Wikis, shared docs, spreadsheets and memory. None of them can say where a fact came from or what a change will break.

19% of respondents in narrative roles were laid off: the most of any field in GDC's 2025 survey.[5]

20% of game designers, narrative included, were laid off in the past 12 months (GDC 2026).[6]

When a writer leaves, the canon in their head leaves with them. We found no survey of how teams keep lore; our first design partners will tell us.

Sources: 7 WGA 2023 MBA · 8 Draft2Digital 2023 · 5 GDC 2025 · 6 GDC 2026

Solution

The AI does the reading. People keep the say.

1

Import

Markdown, Word and voice recordings. Sources stay read-only; a new file is a new version.

→

2

AI proposes

Facts, each with the exact sentence it came from. A quote that isn't in the source is blocked.

→

3

A person decides

Accept, edit or reject. Nothing becomes canon without a human.

→

4

Canon

Every fact cites its sentence and keeps who decided it.

→

5

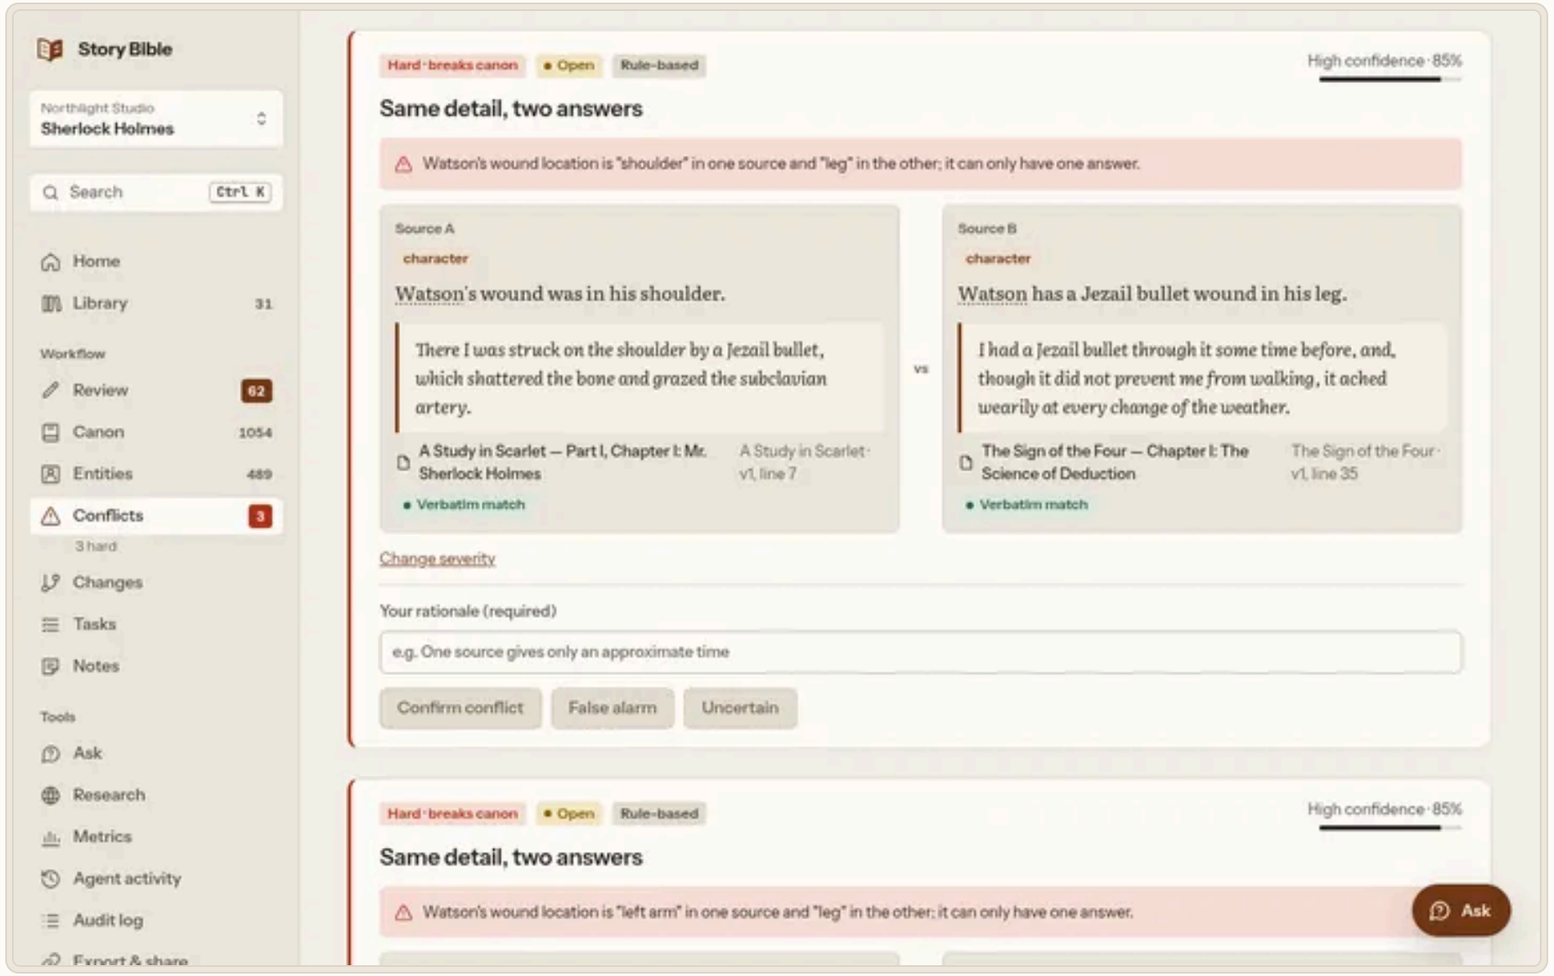

Checks

Conflicts: rules for time and place, travel, relationships and "same detail, two answers".
Impact: what a change reaches, two hops deep.

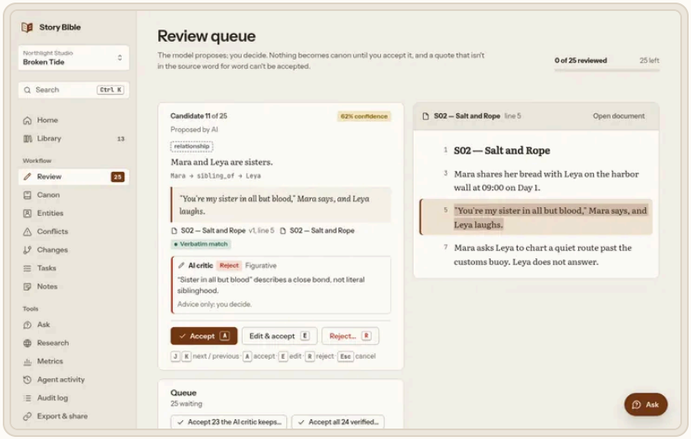

No evidence means the answer is "unknown". The AI never invents a source or a quote.

Product

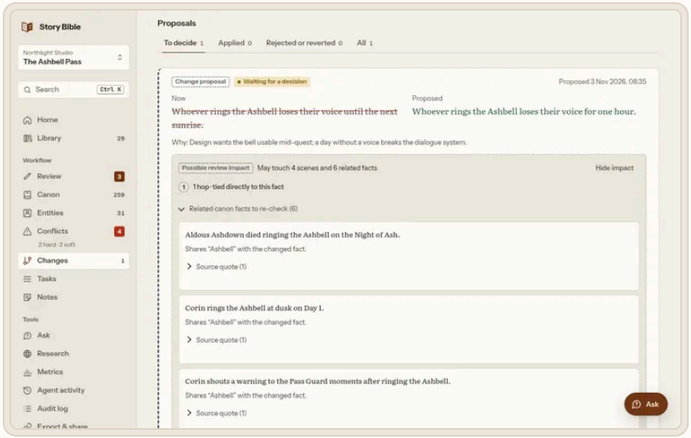

Working today, on real and sample stories

Watson's wound: shoulder in one book, leg in the next. Both quotes, found by a rule.

The AI critic flags a figurative "sister".

A rule change and the scenes it reaches.

Why now, why Meta

Models can read a whole story world. They still make things up.

Muse Spark

Extraction, the AI critic, continuity checks, research with web search, and answers from canon only.

Muse Voice Transcribe

Table reads, voice-actor takes and dictation become timed sources: a citation plays the line.

Muse Image

Portraits and covers for wiki pages. Editorial, never canon.

Muse Code over MCP

An agent works with canon through 38 tools; with a propose token, what it suggests waits for a person.

> **The human gate is the trust layer.** Every AI output is a proposal with a quote, the server checks the quote word for word, and a person decides. That is what lets a studio use AI on its canon.

Built against api.meta.ai: 15 notes for the Meta API team, each tied to a recorded response.[21]

Sources: 21 Meta API notes

Market, bottom-up

SAM $8.5M a year, SOM $196k in three years

Games, Europe = 6,765 seats × $25/seat/month

123,000 people employed in European games (2024)[9] **× 22%** in game design and narrative (share of GDC 2026 respondents)[6] **× 1 in 4** who write story and lore (assumption)

Series fiction = 63,000 seats × $8/month

252,000 authors in Novelcrafter's community (vendor claim)[10] **× 1 in 4** who write a series that needs checks (assumption; 75% of indie sales are series books)[8]

TV, US scripted = 1,548 seats × $25/seat/month

516 scripted series on air in 2023[11] **× 3** writers each, the smallest WGA room minimum[7]

Comics not sized

WEBTOON has 27 million creators, "the vast majority" amateur[15]. We found no count of professional comics writers.

Games, Europe

SAM $2.0M

SOM $61k (203 seats)

Series fiction

SAM $6.0M

SOM $121k (1,260 seats)

TV, US scripted

SAM $464k

SOM $14k (46 seats)

Bars to scale. SOM: 3% of team seats, 2% of writers.

TAM, not valued. The outer bounds we found count people, not buyers: 11.1 million game developers including hobbyists and students[14], and 27 million WEBTOON creators.

How we sized it. Sourced counts × sourced shares × our assumptions (dashed) = seats, × a competitor's list price, not ours: $25 per seat a month for teams (Arcweave Team, yearly)[12], $8 a month for writers (Novelcrafter Hobbyist).[13] Left out: games outside Europe, TV outside the US, film, traditional publishing, comics, tabletop.

Sources 9, 6, 10, 8, 11, 7, 15, 14, 12, 13: full list on the last slide

Business model

Open source to spread, cloud for teams to pay

Open source · free

The whole app under AGPL-3.0. Self-host it; bring your own AI key and pay your provider directly.

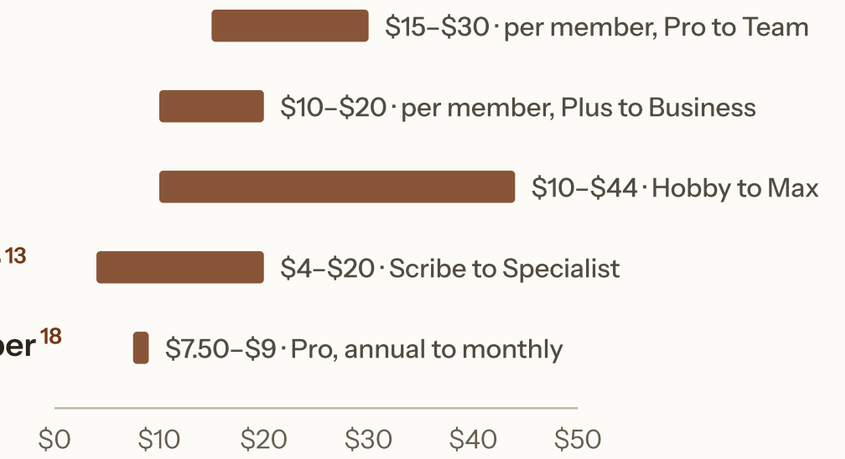

Cloud for teams · ask for a price

We host it for a studio, a writers' room or a writer. Today a price is quoted per team.

Planned, not priced yet

A per-seat team plan and a solo writer plan. AI usage is the main running cost, so cloud prices will cover it.

What people pay for neighbouring tools, USD per person a month (list prices)

Book Check Genie charges per check: £19, or £22–£49 a month.[19] Context only: none of these is our price.

Sources: 12 Arcweave pricing · 16 Notion pricing · 17 Sudowrite pricing · 13 Novelcrafter pricing · 18 LegendKeeper · 19 Book Check Genie

Start where narrative people already gather

Channels

- **Open source first.** A public repo that runs in about five minutes with no API key, and sample worlds with planted contradictions to find.
- **Narrative communities.** Game-writing and narrative design groups, narrative talks at game conferences, indie author communities.
- **Agents as a channel.** MCP setups for Muse Code, Claude Code and Cursor; planned imports from Ink, Yarn Spinner, articy:draft and Twine.
- **Design partners to case studies.** One game team, one writers' room and one series novelist, with results we can publish.

First 90 days

Days 1–30	Repo public. Hosted cloud for three design partners. Weekly calls with each.
Days 31–60	Branching canon (roadmap item 1) with the game partner; first game-script import.
Days 61–90	First paid cloud teams; a published price; one public case study.

We will watch facts accepted per project each week, and how many conflicts teams confirm rather than dismiss.

Sources: 20 Story Bible repo

Competition

Others store lore or write prose. None we checked cites every fact and checks it by rule.

Product	Cited facts	Rule-based checks	Human gate on AI	API / MCP	Price
Story Bible	Every fact, verbatim, checked	Yes: time and place, travel, relationships, same detail	Yes, always	MCP (38 tools) + API	Free self-host · cloud: ask
Arcweave[12]	—	—	—	REST API + MCP (Team tier)	Free; $15–$30 per member/mo
Book Check Genie[19]	—	AI “flags possible slips”	Yes: “the final call is always yours”	—	£19/check · £22–£49/mo
Sudowrite[17]	—	—	—	—	$10–$44/mo
Novelcrafter[13]	—	—	—	—	$4–$20/mo
Notion[16]	—	—	—	Public API	Free; $10–$20 per member/mo
LegendKeeper[18]	—	—	No generative AI	—	$7.50–$9/mo

Where they are stronger: Arcweave already ships an MCP server; Sudowrite and Novelcrafter write prose and we don’t; Notion, Obsidian and World Anvil have communities we don’t have yet. “—” means the vendor’s own page didn’t say, checked 3 Nov 2026.

Proof

Built in 9 days, checked like a product

9

days, 27 Oct–4 Nov 2026, solo, with 260+ commits

4

sample worlds, up to 31 documents and 126,658 words

40

scripted probes and checks that drive the real app

38

MCP tools, under the same roles as people

- **Gold sets with targets.** The Metrics page scores each sample's planted contradictions; on Sherlock Holmes it finds all 4 planted contradictions (4/4) and blocks 62 AI candidates whose quote isn't in the text.
- **Every AI agent is traced.** Agent activity shows each run, its steps, and what people did with its output.
- **Real Meta responses as contract tests.** 23 recorded responses from api.meta.ai replay in a fake server.
- **Open source under AGPL-3.0.** Self-host it today. No users or revenue yet: this is day zero.

Team

A solo entry, with a company behind it

Umurcan Görür (Umur)[22]

Founder and engineer. Built Story Bible alone for this hackathon.

- Paid to write code at fourteen.
- Co-founded three companies; one closed when the money ran out.
- CTO of a company of about fifty people.
- Taught Ruby to around 150 students.
- Builds Orka, an open-source way to run teams of coding agents. Story Bible was built with it.
- Runs a homelab of about a hundred devices, where he tests things.

TekTık Yazılım AŞ · tektik.ai[23]

The company that will develop and host Story Bible.

- **TekTık Asistan:** an office assistant in WhatsApp and Telegram, in beta with companies in Türkiye, with a first UK pilot.
- **AI API reseller:** several AI models under one invoice.
- **Custom AI software** and integrations.

The hackathon entry is Umur alone. TekTık gives Story Bible a company to sign contracts, bill and host from day one.

Roadmap · not built yet

What canon means in context: an episode, a quest, a player's choice

Next

Branching canon: facts true only on one player path, checked per ending.
Project-level access for outside writers and translators.

Series

Story time apart from release order, canon "as of" an episode, who knows what and when, setup and payoff.

Games and localization

Quest dependencies, game-script import with bulk checks, DLC and patches, an approved-terms glossary for translators.

Create the perfect world for your story.

We are looking for design partners: a narrative team, a writers' room and a series novelist. info@tektik.ai · github.com/ugorur/storybible
